Dear Alan,

I thought you may like to see the enclosed. It will probably not be submitted for some time since it has to be approved by Mt Stromlo and Siding Spring Observatories who are notoriously slow (but who, I hope, will pay for publication!). I'm gradually working through paper on interpretations of spectra, and time variability... I couldn't afford to get all of figure 4 (spectra) reproduced so I've included a sample.

We saw a copy of your paper with George Brandie (via Green Bank) on the 8000 MHz survey, and thought we might try to observe MA 1535 +00 (since it's not too faint & available now), but on measuring optical position found it was 8.5 and 3.1 arcseconds off the radio position (in RA and dec. resp.).

P.T.O.

We'd like to try a couple of the others later, unless someone else is already planning to?

We were wondering also what unconfirmed but suggested identifications (particularly "QSOs") remain in the strong source survey at 1400 MHz?

Also, do you know whether anyone is following up Mike Davis' 5000 MHz survey?, Kellermann et al. surveys? .....

We hope you've both been well and are happy and healthy living in the backwoods.

Best wishes to you and Mary

Ben and Derek.
