Hello Robert. Peter's measurements have bestirred John Wardle, who I had not heard from in quite a while, into starting some analysis of the quasar sample vis a vis orientation statistics. He'll be circulating his ideas very soon to all the group. Obviously it's getting close to the time at which I should attempt to summarize the measurements people have made and try to understand the differences between them. Any chance of yours being available for this ?

Will you be coming to the "unified models and compact sources" meeting in Socorro in October? Many of our "mega-collaborators" will be there.
