Dear Alan,

In writing up another QSO-galaxy spectroscopy paper, we have results on 3 galaxies you told us about once. They are 0217+017, 1146+596 = NGC 3894 and 1753+183 = NGC 6500. Redshifts are 0.0407, 0.0108 and 0.0101, respectively (we probably sent preliminary values a while ago). As our memories are not great (and because you publish so much stuff!) can you remind us about these? Do they have VLBI-detected components, do you know of published finding charts, and to which of your papers should we refer?

Sorry to be relatively lazy. Hope you had a great Christmas and that you and Mary are all set for a great 1979.

Best wishes,

Derek, Bev
